INTRODUCTION TO CRYPTOZOIC

Super public chain · Anonymous fortune · Energize digital finance

Cryptozoic

The future value of Cryptozoic

Era of cryptocurrency

Era of blockchain

Era of anonymous era

Anonymity has arrived to reshape the nature of blockchain

- ➢ A Fortune radical system of infinitely increasing value.

- ➢ A Free imagination for the future financial ecology.

- ➢ A Revolution to the past finance.

Cryptozoic

Shared application development environment · Fully anonymous DApps

Global geeks build communities together · Free Internet and open interaction

application scenarios · To achieve exponential growth of fortune

Origin

Respect to the pioneer of cryptocurrency, Bitcoin

Respect to the pioneer of blockchain ecology, Ethereum

Respect to the anonymous era arrived, Cryptozoic

Bitcoin has created the cryptocurrency miracle.

Ethereum is a monument to the blockchain era.

History is constantly being rewritten and subverted.

Anonymous age "Cryptozoic" new era has come.

Ancient

Timeline: eon, era, period, yuan, year

The cryptozoic is 4 billion years old, where there is no life but space

Today's Cryptozoic represents another beginning of era.

If bitcoin is compared to the archean phase, ethereum is like the ancient eon phase, and the Cryptozoic project is like the earth entering the phanerozoic phase. Cryptozoic is a symbol, meaning that cryptocurrency finance will enter the next development moment.

Cryptozoic

The team who developed the Cryptozoic discovered the monetary characteristics of bitcoin, the property of ethereum platform, and the importance of anonymity in the deep development of ethereum value.

Cryptozoic integrates cryptocurrency, blockchain application, smart contract and anonymous transaction. In terms of technology, in addition to the application of blockchain technology to ensure the decentralization of financial transactions, one-time ring signature cryptography technology will be used to ensure hiding node IP, trading address and encrypting key information, etc., so that all users of the Cryptozoic will enjoy an absolutely free, secure and tamper-resistant anonymous network. Every transaction, every element, and every frame of events that occurred on Cryptozoic network expresses the hidden functions.

Anonymous transactions, privacy security, person to person, project to project, enterprise to enterprise, country to country, time and space, infinite possibilities.

Cryptozoic and VCC

◆ Bitcoin：BTC

◆ Ethereum：ETH

◆ Cryptozoic：VCC

◆ The value of these 3 epoch-making symbols is bound to be extraordinary.

The origin of"VCC"

The decentralized application ecology presented by ethereum is the inspiration source of VCC.In great respect, we have included the name of Vitalik Buterin, founder of ethereum, in the name of Cryptozoic Coin, Vitalik Cryptozoic Coin.

But in fact, we have essential differences. The mission of VCC is not only to maintain the stable operation of the blockchain application ecology, but more importantly, it will be a seed with explosive potential in the future finance.

Tribute to Vitalik Buterin, founder of ethereum

Based on the cryptozoic public chain creation block release

Unlimited fission capacity and appreciation space

Cryptozoic

Salute to Vitalik Buterin, founder of ethereum.

Based on the cryptozoic public chain, the creation block is released.

Unlimited fission capacity and appreciation space.

Roadmap of Cryptozoic

◆ Dark era

◆ Topological era

◆ Expansion era

◆ Constant era

Era period

	brief description	Gameplay and rewards	start	termination
dark era	The dark era(genesis) is an important period of cryptozoic ecological evolution and a solid foundation for the construction and prosperity of cryptozoic ecology.	E2V (IEEX) , dandelion flying program, dandelion exploration program, dandelion make-a-wish plan, lucky wanderers	APP officially launched, that is IEEX launched.The dark era starts.	E2V After 200 layers, the dark era automatically ends.
topological era	The topological era is not only the era of continuous construction and improvement of cryptozoic ecology, but also the era of burst of ecological application.	E2V (CEEX) , dandelion flying program, dandelion exploration program, dandelion make-a-wish plan, lucky wanderers, believers, super believers, super nodes	After E2V IEEX terminates. CEEX is launched and the topological era starts.	E2V After 900 layers (IEEX 200+CEEX 700) , the topological era automatically ends
expansion era	The expansion era will be a relatively stable, healthy and strong stage of ecological development. All kinds of applications and services will go deep into every aspect of people's life.	E2V (LEEX), V2E repurchase, dandelion flying program, dandelion exploration program, dandelion make-a-wish plan, lucky wanderers, exploration rankings, network rankings, lucky believers, believers, super believers, super nodes, warrior program, XXEX, E2V Trade rankings	After E2V CEEX terminates. LEEX is launched and the expansion era starts.	LEEX After 1000 layers, the expansion era automatically ends.
constant era	The constant era is the stage of fortune conservation, and will be committed to the development of ecology and application.	E2V (LEEX) , dandelion flying program, dandelion exploration program, dandelion make-a-wish plan, lucky wanderers, believers, super believers, super nodes, warrior program, XXEX and other ecological gameplay	After the expansion era terminates.	There is no deadline, during which the E2V layer remains unchanged and the ratio remains constant forever.

Each era in the development process is also divided into some microera. When the block height of cryptozoic chain reaches a certain height,the current era(or microera) ends and enters the next era(or microera)

Cryptozoic layout

Public chain system

international community
conviction motivations

Anonymous transactions

Ecological Authenticator

Cryptozoic-capital

Application landing

public chain system

Type: Open source blockchain application platform

Consensus mechanism: POW+MPOS+Cryper (original consensus)

Account model: UTXO+ contract account

Anonymous technology: One-time ring signature

Transaction processing: sharding

Currency: VCC (dynamic)

Block speed: 10s/ block

Each sunrise block: 8640

Peak TPS: 80,000

Key characteristic: absolute anonymity, public verifiability, high concurrency and high scalability

Cryptozoic public chain is also a completely compatible ecosystem with ethereum. All Dapps running on ethereum can run on cryptozoic. All cryptocurrencies issued on ethereum can be compatible with the cryptozoic privacy and anonymous trading environment.

Issuing Mechanism of VCC

●Initial block issuance based on blockchain system

●There is no limit to the total release of VCC, which is mainly divided into two parts.Pre-mining stage and ecological mining stage.

Premining VCC

In the initial stage of cryptozoic eon, a part of the pre-dug VCC of public chain will in an open and transparent way,

be used as the initial ecological construction fund of cryptozoic eon to ensure the smooth implementation of basic ecological.cooperation.

Conviction Network

Wealth preservation：

In order to promote the fission capacity of cryptozoic network, cryptozoic invented twin-ex mechanism, and the original twin-ex provides self-regulation of VCC value, enabling VCC to maintain its value continuously.

Wealth increasing：

Cryptozoic original dandelion network makes VCC belief sufficient. As long as there is one person on earth who has not joined cryptozoic ecology, the value of VCC will continue to increase.Network size represents the volume of wealth, and the expansion of cryptozoic network volume will increase the value of individual wealth.

Value balance mechanism of TWIN-EX

➢ Cryptoeon first proposed twin-ex trading mechanism, which can be divided into E2V (ETH one-way exchange VCC) and V2E(ETH buyback destruction VCC). This makes the inseparable two-way value anchoring between VCC and ethereum, and makes the future market circulation and value of VCC subject to natural market regulation.

➢ The initial VCC in the TWIN-EX is generated by pre-mine, with a total number of 327,300,200.

E2V

IEEX

When the cryptozoic public chain starts, it automatically opens the IEEX trading channel

CEEX

After the end of IEEX, it automatically enters the CEEX stage.

LEEX

After the end of CEEX, it automatically enters the LEEX stage.

"E2V"is completed in three stages, namely IEEX stage, CEEX stage and LEEX stage.

On entering the "E2V" phase, users can exchange ETH for VCC。

IEEX

- IEEX is divided into 4 gear positions, each gear position contains 50 resonance layers.

- Each layer resonates with 200 ETH directly into the upper layer.

- ratio：the initial number is 1ETH: 1800VCC, and the resonance ratio decreases by 2 VCC layer by layer.

- Extra reward multiple refers to the number of resonant VCC in each gear position.

- The first gear is 5 times;

- the second gear 4 times;

- the third gear 3 times;

- the fourth gear is 2 times.

- 200 -------------- 1ETH=1402 VCC

- 199 -------------- 1ETH=1404 VCC

- .   .   .

- .   .   .

- .   .   .

- 5   ------------ 1ETH=1792VCC

- 4   -------------- 1ETH=1794VCC

- 3   -------------- 1ETH=1796VCC

- 2   -------------- 1ETH=1798VCC

- 1   -------------- 1ETH=1800VCC

- There are 700 layers.Each layer resonates with 200 ETH directly into the next layer.
- Initial resonance ratio 1ETH: 1400VCC, and the resonance ratio decreases by 2 VCC layer by layer.
- The reward multiple is 1 times.

- The total is 100 layers. Each layer resonates with 200 ETH directly into the next layer.
- Initial resonance ratio 1ETH: 1VCC, and the resonance ratio decreases by 0.01 VCC layer by layer.
- The reward multiple is 1 times.

CEEX

LEEX

The earlier you enter twin-ex, the higher the conversion ratio and the eward multiple.

V2E

Enter the topological epoch (when block height reaches 207360) and enable the "V2E" repurchase function.
The ETH of TWIN-EX pool is used for the repurchase and destruction of VCC.

The number of ETH per period in the V2E pool=The total ETH in the last microera E2V pool *30%
After opening, the settlement shall be made on schedule, and the settlement shall be fully converted
according to the current number of ETH and VCC in the pool.

The ratio of V2E is dynamically variable. According to the ratio between the total number of VCC and ETH in
the destruction pool in this period, the smaller the number of VCC involved in this phase, the larger the
number of ETH

Users participating in this phase of exchange hold VCC up to the specified amount (100,000) and can use
V2E

In order to reward hermits who made great contributions in E2V, the cryptozoic network introduces E2V transaction rankings, which will be opened in the topological era and the expansion era.

Statistical rules

when reaching a certain height of the last block of each micro-epoch, count the number of each address participating in E2V, rank the top 20 in order from most to least, and participate in the calculation of rewards.

TWIN-EX E2V Rankings

Reward objects and calculation rules

20% of the E2V ETH in this microera is as the reward for E2V rankings.

Ecological mining stage

Block start height	End height of block	Block spacing	Block rewards
1	1,280,000	1,280,000	64
1,280,001	3,840,000	2,560,000	32
3,840,001	7,680,000	3,840,000	16
7,680,001	12,800,000	5,120,000	8
12,800,001	19,200,000	6,400,000	4

- Gold mining period: Starting from the height of 19,000,001 block, the reward is constant 2 VCC.
Dandelion network

Dandelion network is an original high viscosity relation network in cryptozoic. All individuals in the network can establish proximity relation.

Different from hierarchical relation network

We believe that hierarchical fission can only increase the number of participants, but cannot increase the degree of correlation of participants. Without correlation, the fission network is more like an independent building, and it is difficult to unify the consensus among buildings due to the independent governance within buildings.

Dandelion network has stronger inter-individual correlation and higher consensus degree

which makes cryptozoic network stronger and higher consensus value.

Introduction of Dandelion

CA

ID

CAID activation mode

Direct activation

Discovery activation

When each person enters the dandelion network, a unique identification ID, namely CAID will be the unique and universal identity mark of cryptozoic eon. No matter it is the community ecology, the application of Dapp, or the use of exchangestheir respective permissions and qualifications will be formed based on CAID authentication.

CAID is a source point in dandelion network. To be discovered or discovered, every CAID must establish at least one proximity relationship with path 1 before it can be activated. Every two CAID can establish an proximity relationship with each other, which determines the individual benefits of CAID.

pay a certain amount of VCC to the activated CAID and establish an adjacent relationship with this user.

through the fluttering program unique to the dandelion network, it is activated by establishing proximity relationship with CAID that captures a fluttering program enabled;

Dandelion path rewards

As shown in the figure:

Revenue sharing model based on reverse path,
pay VCC to build contiguous relations.

Target hermit C is taken as an example. If hermit E activates E through CAID of C, when hermit C gets VCC revenue, C gets 60% of sharing revenue. 25% is divided by all the hermits with a reverse path of 1, and 15% is divided by all the hermits with a reverse path of 2. (special note: D is the forward path 1 of C and does not participate in revenue sharing)

Conclusion:

the earlier you join the dandelion network, the more rewards you get, the earlier you build proximity, the more rewards you get.

CAID path rewards are designed to encourage CAID expanding network relations and reinforce dandelion networks by building contiguous relations. The reward comes from the VCC paid by the newly activated CAID. Specific rewards are as follows:

- The VCC of establishing contiguous relations payment is divided into three parts: sharing revenue (80%) and fund contribution (10%), and smart contract automatic destruction (10%).
- 60% of the Shared revenue will reward target hermit directly.
- 25% of the shared revenue is divided equally by CAID with the hermit reverse path of "1".
- 15% of the shared revenue is divided equally by CAID with the hermit reverse path of "2".
- In the dandelion network system, all the shared revenue are found and issued in reverse path.

Dandelion Program

Flying Program

3600 VCC locks are required to start Flying Program, andexpose i CAID to the dandelion network. You can exit the flying program at any time, and the VCC locked will be unlocked automatically.
Both parties enjoy the VCC rewards from the expanding relationships network.

exploration Program

Exploration program and flying plan are complementary to each other. Through exploration program, CAID can find the CAID that started fluttering plan in dandelion network and establish a close relationship with it, so as to expand the scope of CAID's social communication system and obtain more benefits.
To participate in the Exploration program and establish close relationship s, you need to pay 50 VCC.

Wandering program

Based on the dandelion network ecology, wandering fund was set to reward outstanding contributors and lucky CAID in the current era. In brief, it is a reward system to give reward from multiple dimensions and randomly lucky draw.

Motivations Network

Developers, miners, community contributors, etc., are key to the eternal survival of the Cryptozoic

All contribute to the development and maintenance of cryptozoicVCC and ETH awards are open, transparent and fair play for everyone.
Make-a-wish plan

The make-a-wish project is the primary belief in the cryptozoic network, telling all consensual hermits what you want for the future of VCC.

- Each hermit can make a wish to the Cryptozoic VCC
- Fill in and submit to the wishing fountain

- After wishing, VCC will be received from the wishing fountain in return

- The VCC source in the pool is 5% of the total daily mined COINS

- Divide it equally among the hermits who take part in this plan.

Each hermit receives a maximum VCC of 10

Every new recluse who joins the dandelion network has only 5 free wishes

- You can lock 1000 VCC to enjoy unlimited wishing

- You can always quit the make-a-wish plan
- The 1000 VCC locks will be unlocked automatically

Lucky believers

When a microera reaches the last block, the microera ends. From all believers, a certain number of CAIDs are selected to be the lucky believers of this microera, and the lucky believers will be rewarded.

Conditions of believers

must be active CAID and participate in the VCC lockers of 9900.
You can always quit the believers program and the VCC of the lock will be unlocked automatically.

Lucky believers rewards

The rewards are 20% ETH of E2V in the microera process, split equally among the lucky believers.

Lucky believers win the bid rules

From the believers who meet the conditions, every 50 ETH are devoted to E2V, one seat produced. The seats are unlimited.

Rewards distribution

Not applicable to dandelion network rewards revenue model. Lucky believers enjoy the rewards alone.

Super believers

Super believers are deep believers in cryptozoic networks.

Conditions of super believers

must be active CAID and participate in the VCC lockers of 48000.
You can always quit the believers program and the VCC of the lock will be unlocked automatically.

Rewards

At the end of each microera, 20% of the E2V ETH in this microera process are the rewards for super believers. All the super believers get rewards equally.

Super believers win the bid rules

In the block height from 1-128,000,
there are only 400 super believers.

Reward distribution

Not applicable to dandelion network rewards revenue model. Super believers enjoy the rewards alone.
The super node

In order to increase the number of nodes in the network and ensure the stability of the network,

Cryptozoic networks need more belief nodes to join and set up super nodes

Node qualification

Lock up 126000 VCC
And build real physical network nodes

You can exit the super node at any time
The VCC of the lock will be unlocked automatically

Rewards

The cryptozoic network will split 30% of the new mined VCC equally to all super nodes. The new blocks generate real-time rewards.

The winning rules for Super node

In the height interval of block 1-128,000
The maximum number of super-believers is 128

XXEX -Anonymous exchange

Complete decentralization

This is a decentralized exchange, where assets are directly tied up and algorithms are matched, and no third-party fund precipitation is involved.

KYC authentication is not required

Anonymous exchange is based on Cryptozoic anonymous identity authentication service, which makes user identity unique, secure and anonymous without traditional KYC authentication.

Trading completely anonymous

Hide user IP address, hide transaction address, encrypt transaction data, only user authorized to view.Fully anonymous transactions, withdrawals and currency exchanges are implemented to ensure that transaction addresses and personal information are not tracked

T+0 real-time settlement

The transaction is settled, and there is no need to transfer multiple accounts. It supports merchants' C2C transactions and earns cash & withdrawal at any time.

Cryptozoic Authenticator

Cryptozoic will originally create an anonymous authentication system called cryptozoic authenticator, which is a two-step authentication software token based on a one-time cryptographic algorithm of time and hash. It can be used for anonymous authentication service of any other software system. The usage mode is the same as Google authentication, but the difference is that cryptozoic authentication is absolutely anonymous, which uses the private key of users in cryptozoic public chain as the basic cryptographic algorithm.

Cryptozoic

Cryptozoic Assets

Fortune-multiplying systems

The closed-loop VCC value-added model multiplicates the fortune of participants.

Quantitative financial transactions

Digital tokens quantification principle, help users' financial investment.

Digital freedom

Decentralized environment gives free trade, free interaction.

application ecology

Cryptozoic is an ecosystem of anonymous era composed by cryptocurrency, blockchain applications, smart contract and anonymous transaction.

It allows developers to introduce innovative technologies and killer applications of model-exploiting , and meanwhile supports magnitude transaction processing and financial business.

It is an ecologically decentralized underlying system based on financial ideas

More anonymous

Fission financial ecology

1

The original TEIN-EX model of Cryptozoic and dandelion networks create a sustainable fission environment on which any fission financial application can be made.

Developer ecology

2

Cryptozoic is a completely open environment that encourages developers around the world to participate in further innovation and improvement. We provide wide and compatible API interfaces and simple SDK toolkit.

Privacy anonymous ecology

3

Cryptozoic provides an absolutely anonymous environment for global participants. Any personal privacy, trade secrets or non-disclosure can be handed over to the cryptozoic for transaction processing.

Dapps ecology

4

Dapp is the future development trend. Cryptozoic is not only a huge financial system, but also a stable and reliable Dapp operating system. We encourage application developers using our system to run.

Digital assets management ecology

5

Cryptozoic will be developed for multi-chain and multi-currency in the future, absorbing global digital assets to form a complex digital assets management network.

1800：1

1：1

1：1800

- If 1800：1 is the beginning of an era.

- Then 1：1 is the witness to the cryptozoic conviction.

- Only 1：1800 is the future of cryptozoic fortune.

We believe, we see – Cryptozoic has arrived.

THE AGE OF ANONYMITY HAS ARRIVED,

BRINGING BLOCKCHAIN BACK TO ITS ESSENCE

Co-building • Co-creation • Sharing • win-win

http://www.cryptozoic.io/
